Introduction

NHS England’s mandate includes:
A goal of improving local and national health outcomes particularly addressing poor outcomes and inequalities to be achieved by 2020 and monitored as part of the Clinical Commissioning Group’s assessment framework.

The General Practice Forward View published on 21 April 2016 developed by NHS England, Health Education England and the Royal College of General Practice commits to strengthen general practice in the short term and support sustainable transformation of general practice in the future.

Strengthening and transforming general practice will play a crucial role in delivery of Susttainability and Transformation Plans (STPs).

The General Practice Patient Survey suggested that some groups of patients are experiencing barriers in accessing primary care services and the National Audit Office has proposed that new initiatives should work towards reducing these inequalities as well as improving access overall.

The Equality Act 2010 prohibits unlawful discrimination in the provision of services on the grounds of age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, race, religion or belief, sex and sexual orientation. These are the “protected characteristics”.

Under the Health and Social Care Act 2012, CCGs must, in the exercise of their functions, have regard to the need to reduce inequalities between patients with respect to their ability to access health services, and reduce inequalities between patients with respect to the outcomes achieved for them by the provision of health services.

People are experiencing poorer outcomes from poorer access to services which in turn could have an adverse impact on their life expectancy.

£5.5 billion per year

The Marmot report referenced by the National Institute for Health and Care Excellence (NICE) suggests that in England the cost of treating illness and disease arising from health inequalities, has been estimated at £5.5bn.
Introduction

For providers and commissioners of general practice services

If you are a provider or commissioner of general practice services this document is designed to support you in understanding whether any groups within your local community are experiencing barriers in accessing those services and provide resources to help you address those barriers as improvements in access to general practice services are rolled out.

The document will:
- guide you in assessing local issues
- support you to complete local equality analyses
- review a journey through a patient pathway to demonstrate how barriers arise at different points
- share case studies including wave one General Practice Access Fund (GPAF) to demonstrate good practice
- and provide plenty of top tips and useful reference sources.

For General Practice Providers

This resource will help general practice providers to identify and address barriers and allow improved access to the full range of general practice services, including reducing barriers to patients becoming registered and for those currently registered to engage with high quality general practice services proving safe effective and appropriate care provided by a wider range of health professionals.

Reaching vulnerable groups will improve outcomes for your local population and help you achieve clinical targets, for example Quality Outcome Framework or locally agreed outcomes.

Care Quality Commission (CQC) registration requires compliance with Regulations 9 and 10: having due regard for people with protected characteristics and person centred care.

For General Practice Commissioners

In line with the NHS Operational Planning and Contracting Guidance 2017-19, CCGs are setting out plans for delivering full extended access by March 2019. Some areas are already delivering the requirements set out in the planning guidance which include addressing inequalities in access where they exist. This resource will help CCGs better understand how to meet the needs of local population as part delivering improved access.

There are currently significant inequalities in different groups’ experience of access. Whilst making changes designed to improve access, CCGs will ensure that new initiatives work to reduce inequalities as well as improve access for all.
Understanding your local population

This section of the resource will help providers and commissioners of general practice services understand the challenges faced by your local population. It provides tips on participation and identifies useful sources of local information.

Why patient and public involvement?

The patient pathway section identifies individuals and groups sharing one or more protected characteristics who do not currently experience easy access to general practice services, and subsequently do not experience the same health outcomes as the rest of the population. This may include those insecurely housed, Gypsy, Traveller, and Roma groups, refugees, asylum-seekers, migrants, sex workers and faith groups. Additionally, people with mental health problems, learning disabilities, low health literacy, and drug and alcohol problems may be similarly challenged. Those not registered with practices may also be subsequently ‘invisible’ in the primary care system.

Commissioners of general practice services should also understand the perspectives of children and young people, carers, and patients and service users with disabilities and long-term conditions. Due to the diversity of those who may share one or more protected characteristics (for example, young Asian men), it is crucial that commissioners of general practice acknowledge that ‘one size doesn’t fit all’.

Many CCGs have patient reference groups and support locality networks of patient participation groups (PPGs) as a way to involve local people in commissioning.

Patient and public participation is an essential component of commissioning, and should be considered at all stages of the commissioning cycle (planning, buying and monitoring health and care services).

From April 2017, over 97% of CCGs will have fully delegated authority and be commissioners of general practice services.

Top Tips for Participation

Resource

NHS England has supported The National Association for Patient Participation (N.A.P.P.) to produce ‘Building better participation’ a resource to support PPGs –whether long-standing or recently formed, large or very small, a single practice or as part of a federation of practices –to reflect on what they do.

This is a useful tool for GP practices and CCGs seeking to support effective PPGs.
Where to look for your local information

Local information resources include:

- Right Care Commissioning for Value packs
- NHS Choices website
- Healthwatch, local authorities
- Care Quality Commission (CQC)
- Feedback websites such as Patient Opinion, inspection reports, charities
- Complaints
- NHS Friends and Family Test
- CCG Improvement assessment framework
- Social media
- Local patient feedback via your Patient Participation Group (PPG)
- Joint Strategic Needs Assessments (JSNAs)
- Patient Lists
- NHS England website (Commissioning Primary Care).

General Practice Outcomes Standards and General Practice High Level Indicators are available through the Primary Care web tool. Practices can monitor the demographics of their patient lists to inform service provision. See www.primarycare.nhs.uk for more detail.

Results from the General Practice Patient Survey (GPPS) can be viewed and sorted into Clinical Commissioning Groups (CCGs), practices, participant groups, survey questions or by trends.

- Note that people not registered in general practice services are not included in survey feedback
- There are groups such as people with disabilities or those who cannot speak English for whom these feedback channels are less accessible
- There are strong arguments in favour of going beyond existing insight sources such as holding focus groups discussions or using targeted qualitative methods (specialist surveys).

Helpful guide

‘Choosing and Buying Services Together’
This guide gives step by step guidance on how to involve the public in planning, designing, buying and monitoring services, and advice on how to work with Healthwatch and voluntary sector organisations (inc. faith groups). It also includes examples of engagement tools that can be easily implemented in any community.

NHS England Framework for Patient and Public Participation in Primary Care Commissioning

This framework is a guide for primary care commissioners - and anyone who is interested, including patients, the public, the voluntary sector, providers of health and social care services – on how to involve patients and the public in the commissioning of primary care services.

CCGs are likely to use many of the same approaches, networks and insight sources outlined in this framework. NHS England and others, such as local Healthwatch, may refer to it when working with CCGs on public involvement in primary care commissioning.
This section uses a six-stage patient pathway developed by Ford, JA et al (2015) to illustrate key factors influencing a patient's ability to access general practice (GP) services in England. The pathway offers a helpful framework to explore personal, community and healthcare barriers that may limit access to GP services and how patient experience may differ depending on an individual's characteristics (including protected characteristics), circumstances, and the capacity of local GP services to respond.

**TOP TIP:**
The patient pathway can help you identify barriers along a patient’s journey and target local action to improve patient experience.

As well as the pathway to accessing general practice services there are other pathways including self care and community pharmacy.

This list of factors to consider when seeking to improve access, gives direction and an overview to help you as general practice service providers and commissioners. It will help to identify and transform barriers that affect your local population’s ability to easily access GP services (registered and non-registered patients). Where relevant there are illustrated examples of health inequalities.

**How to navigate the pathway:**

> You can navigate across the six stages
> The factors are listed on the left hand side (noting that factors may be relevant to more than one part of the pathway – links will be provided)
> Each page will include a description of the factor, an indication of how they relate to those who share one or more protected characteristics, along with tips and resources
> This section should be read in conjunction with 'improving access to general practice'.
1. Identification of health problem

The first step on the pathway is identification of a problem. Poor health literacy can be a barrier across the whole pathway however literacy level/education status, low social interaction and/or denial can prevent people from recognising a health problem.

Health beliefs - whether cultural, religious or other - can lead to an inability to recognise an issue for example mental ill health or people may explain the problem as a spiritual rather than a health issue.

An individual’s social network – support from friends and family; and whether or not someone has had a problematic experience with a health issue, can play a key role.

Case study

50 Practice Health Champions working alongside the practice team

Patients at the practice are invited to be trained as volunteer Health Champions. These engage with other patients, understand needs and organise activities. They run 19 different groups for patients, and support service delivery within the practice.

Practice Health Champions, Robin Lane Medical Centre, Leeds - Practice based navigators
Health literacy is defined as “The personal characteristics and social resources needed for individuals and communities to access, understand, appraise and use information and services to make decisions about health.” World Health Organisation (WHO), 2015.

Health literacy defines a person’s ability to identify health problems and to know where and when to seek support. They need the skills and confidence to discuss their illness and treatment with doctors or nurses, asking about options or questioning why a treatment might be right for them. Health literacy also affects how people evaluate experiences and connect with initiatives that seek to address health inequalities.

Health literacy and adult literacy and education levels are entwined. Despite there being significant regional variation low functional health literacy is a problem for everyone; even in the least deprived areas there is still a significant proportion of the population who cannot understand health materials.

This summary aimed at commissioners and providers of health services will explain what health literacy is, how it contributes to health inequalities and provides examples of strategies to address issues.

This NHS England Asylum Health National pilot based in Greater Manchester supports people seeking asylum in accessing and navigating the health care system.

TOP TIP

This video includes some useful tips on dealing with health literacy issues.
Problematic experience causing health issue

Some groups are more at risk of developing a health and wellbeing problem due to an experience such as drug and alcohol addiction, gang or serious youth violence, harmful sexual practices, domestic violence or harmful cultural/religious practices such as female genital mutilation and modern day slavery. For these groups it can be difficult to identify health issues which require intervention or to make a decision to seek help.

Homelessness, poverty, drug abuse and violent victimisation faced by female sex workers create needs for health and social services, but also barriers to accessing services.

It is estimated that there are about 80,000 sex workers in the UK (with up to 20,000 of them migrants).
2. Decision to seek help

When a problem has been identified a patient will decide if they should seek help. This decision can be affected by factors such as ‘candidacy’ which includes a patients understanding of the local health system, the effort required to attend an appointment, what the possible consequences will be, if the service will meet their need and if they can continue to manage independently without needing to seek healthcare.

Health beliefs - whether they are cultural, religious or informed by other beliefs – can also play a crucial role in deterring an individual from seeking help.

Personal factors such as literacy and educational status, expectations of aging, stoicism and self-esteem; resources available (such as finances, support from friends and family, transport) carer responsibilities; perceptions of health services (such as perceived limited resources in healthcare) and historic experience of healthcare, all play a role in supporting or hindering an individuals decision to seek help.

New migrants, refugees and asylum seekers may struggle, especially if they feel uncertain about their entitlements, perceive a lack of need for healthcare or hold any fears about an overlap between health and immigration services. See GP Registration.

“One patient with arthritis came in to hospital unable to move due to swollen joints. It turned out that her appointment four months ago had been cancelled but she hadn’t known how to get help, and so had simply lived with her deteriorating symptoms.”
Compliance with medical treatment can be affected by health beliefs of an individual or a group. In addition, the ways in which ill health is defined can negatively influence help-seeking behaviour.

Health behaviour is any activity undertaken, or not undertaken, by a person for the purposes of preventing disease or detecting it at a symptomatic stage.

All cultural groups hold concepts related to health and illness. Although people might share the same ethnicity an individual's socioeconomic, educational, geographic, religious among other factors will shape cultural beliefs.

**Health beliefs of different cultural groups to consider**-
- defining health and illness
- disease causation
- preventative measures and cultural treatments
- view of health and social care practitioner.

Introduction

Resources

Improving access to general practice

1 Identification of health problem

2 Decision to seek help

3 Actively seek help

4 Obtain appointment

5 Get to appointment

6 General Practice interaction

Understanding the health system

A patient's ability to navigate the health system and candidacy can affect their decision to seek help.

Candidacy can be considered as:

- **Identification** – how people recognise they need a service
- **Navigation** – awareness of the services on offer and how to access them (including physical accessibility and transport – (see stage 5 of the patient pathway approach)
- **Permeability** – the ease of using the services (i.e. is it a drop in service?)
- **Presentation** – the ability to self-present, and communicate 'need'
- **Professional perceptions** – lack of knowledge about requirements when registering patients. For example, those who are homeless or new migrants / asylum seekers.

Health information in other languages

Migrants (especially asylum seekers) may find it difficult to understand that general practice refers to other services and ensures patients receive the right care at the right time.

- Some patients (for example Roma) may have a limited understanding of which services are available and referrals to specialist services
- People who do not have English as a first language and may require information in appropriate formats
- Due to lack of knowledge of general practice services, ex-offenders on release from prison are part of the large proportion of people using the NHS’s urgent healthcare services.

TOP TIP

Patients do not need to be resident and if they cannot produce documents they should still be registered. See Standard Operating Principles

NHS Choices provides health information resources in other languages
Support networks (Family, Community and Social)

An individual's support network has a role to play in identifying a health problem and whether they actively seek healthcare support.

People draw upon what is termed a ‘lay referral’ system which includes family, friends and the local community.

- Going outside of the family unit for health support is a relatively new thing for many communities including Gypsy, Traveller, and Roma
- Many older people require help from another person to access services
- Homeless people, and carers from refugee or new migrant communities are likely to have difficulty understanding health and social care systems and also may lack social networks.

Healthcare and people who are homeless: Commissioning Guidance for London

Nationally, commissioners may wish to use these commitments as guiding principles in their work to improve services.

This guidance outlines 10 commitments for improving health outcomes for homeless people in London, including ensuring services offer extra support to assist people experiencing homelessness to navigate the healthcare system e.g. registering with a GP, hospital attendance, community follow-up and completing courses of treatment.
3. Actively seek help

If a problem requires healthcare, the next step is to actively seek help.

People are more likely to seek help from general practice services if they feel a sense of belonging to the practice with which they are registered, believe it will be of some help and are empowered to seek it out. Health literacy, previous experiences with healthcare, personal resources such as confidence and access to adequate transport can influence an individual’s decision to seek help.

Some groups like recently arrived migrants will be encountering general practice services for the first time and do not have an established community base to support them. Their experiences and expectations of healthcare are likely to differ from established ethnic minority patients who are familiar with general practice services and more likely to be confident in speaking English. Established migrants may have access to a practice where their first language is spoken or where they can consult with a doctor from a similar ethnic background.

“Nearly twice as many men as women visit their GP less than once a year.”

Women are much more likely to use health services routinely. Consequently, when they are ill, they are more likely to know how to access services and feel more comfortable with a healthcare professional.

Studies have also shown that common barriers to healthcare are exacerbated for many disabled people, not just in relation to their impairment or long-term health condition, but because of reduced access to services and generally higher levels of social deprivation. This is particularly the case for those with visual, hearing and mobility impairments.

Patient and community empowerment

Digital inclusion

Experience of discrimination and social exclusion

Empowerment is about individuals gaining a sense of control over their lives and health through development of personal skills, self-confidence and coping mechanisms.

Community empowerment is about people working collectively to shape the decisions that influence their lives and health.

"Empowered patients aren't a nice thing to have, they're fundamental to the survival of the NHS"

Realising the Value Programme aims to enable people to take an active role in their own health and care to develop a new relationship with people and communities.

This project ‘Working with communities – empowerment, evidence and learning’ completed in 2014 sets out a framework for working with communities. It includes:

- the rationale for working with communities
- how community life is a major determinant of health and key concepts
- the family of community-centred approaches
- an overview of the evidence base, outcomes and economic issues
- conclusions and implications for local leaders and commissioners.

Healthwatch England found that many young adults conveyed a lack of confidence about accessing services, feeling that GPs did not listen fully or always believe what they had to say.

Case study

GPs in Slough have been offering 8am to 8pm extended hours on weekdays since July 2014 and on weekends since August 2014 (9am-5pm Saturday and Sunday) for over 148,000 patients. To date patients have expressed in excess of 98% satisfaction with their experience of the new service.

Alongside extended access, patients can subscribe to receive free texts to promote wellbeing, as well as get reminders about routine health checks.

6 General Practice interaction

Digital inclusion

- People with a disability are three times more likely to have never used the internet. In 2014, four million people with a disability had never been online.
- The homeless, offenders, Gypsy, Traveller, and Roma communities and people in some rural communities experience health inequalities. These people are at an additional disadvantage because of their potential lack of internet access or broadband.

The Internet Access by Household and individuals bulletin 2016 states that the internet is now used daily or almost daily by 82% adults in the UK however only 53% of households of one adult aged 65+ have access.

In 2014 this scheme launched an interoperable digital environment for patients and staff to support access and Long Term Conditions management.

In 2016, of the 11% of households with no internet access, 21% relayed that this was due to lack of skills. Further barriers included high equipment and access costs (9%).

NHS England have been working to improve digital inclusion:

TOP TIP
Consider online booking of appointments

Health United Birmingham
(Birmingham, Solihull and Black Country)
Inclusion Health has been used to define a number of groups of people who are not usually well provided for by healthcare services, and have poorer health outcomes. Traditional definitions cover people who are homeless and rough sleepers, vulnerable migrants (refugees and asylum seekers), sex workers, and those from the Traveller community (including Gypsies and Roma).

NHS England’s “Inclusion Health” definition also includes groups of people who are not usually well provided for by healthcare services and have poorer health outcomes. These groups are:

- people who are homeless and rough sleepers
- the Traveller community (including Gypsies and Roma)
- those undergoing or surviving Female Genital Mutilation (FGM) and Human Trafficking
- those who define themselves as being part of the recovery movement, both through substance misuse and mental health issues
- the trans / non-binary community.

Experience of discrimination from both public services and society can cause some people to avoid actively seeking help, especially if this is coupled with a lack of a personal support network. Hate crimes on the grounds of race, religion or belief, sexual orientation, disability and transgender status can seriously affect how people interact with public services. For example, feelings of discomfort and fear of being “judged” can often deter trans patients from accessing health care.

3.3 million lesbian, gay and bisexual people in England

1.7% of adults in the UK identify themselves as lesbian, gay or bisexual. 2.5% of these are in London. 3.3% of 16-24 year olds identify as gay, lesbian or bisexual.”
4. Obtain an appointment

Key factors in obtaining an appointment include whether the patient is registered with a GP, availability of appointments, capacity within practice, availability of clear information, access to a professional interpreter and the ease of booking system. People are less likely to obtain an appointment if they do not understand the system, if appointments are not available at convenient times or if the practice is not responsive to their needs.

Other contributing factors include available personal resources (such as transport, technology, educational status and experience of healthcare).

“In 2011, more than one in three in the Bangladeshi and Pakistani groups lived in a deprived neighbourhood, which is considerably more than any other ethnic group”

In 2015-16, 18.4% of Asian patients (excluding those who can’t remember if they were able to get an appointment to see or speak to someone) reported that they were unable to obtain an appointment when they needed it. If patients cannot access a GP they are more likely to suffer poorer health outcomes, or use other more expensive NHS services like A&E departments.

In 2015-16, 12% of patients responded to the GP patient survey said that their overall experience of making an appointment was poor.

Note poor = very poor or fairly poor
The NHS England Patient Registration Standard Operating Principles for Primary Medical Care (General Practice) states that a lack of identification documents should not be a barrier. However, vulnerable migrants and those who are homeless are occasionally still being refused registration in general practice.

The biggest barrier to general practice registration is the inability to provide paperwork: 39% of registration refusals were due to lack of ID, 36% to lack of proof of address, and 13% to immigration status.

A request for proof of address presents a barrier for individuals sleeping rough or living in temporary accommodation where they are unlikely to have a utility or bank statement registered to their name. Asylum seekers and undocumented migrants are also at risk. These include children, pregnant women, victims of torture, trafficking, domestic and sexual violence.

Many Gypsies and Travellers have reported problems registering as a temporary patient with local GP surgeries.

"Homeless people are 40 times more likely to not be registered with a GP practice than other sections of the general population."

"Uptake of GP registration by recent entrants to the UK has been low; less than a third (32.5%) of new entrants to England who are eligible for tuberculosis screening at ports register with a GP."

TOP TIP

Patients do not need to be resident and if they cannot produce documents they should still be registered. See Standard Operating Principles.
Not being able to match a patient’s first or preferred language can impact on patient experience and health outcomes, the frequency of missed appointments and the effectiveness of consultations. It may have serious implications such as misdiagnosis and treatment, ineffective interventions and, in extreme circumstances, preventable deaths.

There is currently widespread variation in the quality of interpretation services and how patients can book an interpreter. The use of an inadequately trained (or no) interpreter poses risks for both the patient and healthcare provider. The error rate of untrained interpreters (including family and friends) may make their use more high risk than having no interpreter at all.

8 Principles for High Quality Interpreting and Translation Services. These principles cover face to face (including manual or hands-on signing for Deafblind people) and remote interpreting including telephony and visual (or video) relay interpreting. These principles complement the Accessible Information Standard (AIS).

People from the Newham and Waltham Forest Deaf community raised concerns about obtaining an interpreter through their GP and explained how difficulties around communication can lead to confusion over managing conditions, such as taking medication or managing diabetes.

“I have to rely on family, hearing family, to make phone calls. I hate it. I hate having to tell my family, I’m an independent woman. I want to be able to text but my GP doesn’t have access via text or I have to go physically to the GP to book an appointment. Sometimes they tell me you’ve got to phone back in the morning before 09:00 or after 09:00 and I’m thinking: “What do you expect? You expect me to have a hearing person with me all of the time?” I do need my privacy if it’s something private, then that’s really, really difficult. You don’t want to keep telling your mum or your sister what’s going on with an embarrassing part of your body; it’s really embarrassing.”
GP practices across England have different processes for booking appointments.

“Only 63% of Asian / Asian British patients reported a good experience of making an appointment. The lowest level of satisfaction of all ethnic groups.” (GPPS 2015-16)

Pakistani women in Walthamstow reported the short time frame to book appointments in the morning and the queues at practices as being key barriers or reasons for rating an experience as poor.

Gypsy, Traveller, and Roma groups may feel uncomfortable seeking support from strangers, particularly over the phone, and automated telephone systems can prove challenging to navigate for elderly patients who may not be able to hear or understand digital menu options.

Patients with hearing impairments were regularly unable to schedule appointments through telephone appointment booking systems. On the day only appointment policies can sometimes limit opportunities to attend appointments for individuals needing to arrange additional support to accompany them (e.g. arranging for a carer).

“The percentage of respondents who found it easy to get through to their practice by phone has fallen by 8% to 70% since 2011.” (GPPS 2015-16)

In 2015 Healthwatch England reported that many patients reported a positive experience of using online booking and prescriptions services, however the availability and awareness of these options are still low.

TOP TIP
Explore more about the ways patients can currently book appointments with advantages and disadvantages in 'Improving access to general practice' section.
The use of patient record systems general practice services cater to the needs of patients - such as identifying language, carer and/or disability needs (including learning disabilities), and considering cultural and religious factors when treating patients. They can also assist in anticipating appointment time preferences.

The NAO report in 2015 shared that:

- People aged 18-64 tend to prefer same day appointments (58%),
- BAMER groups tend to prefer same day appointments and to see a GP rather than other practice staff

Some individuals who have undergone gender reassignment may have a greater need for privacy. The first appointment of the day maybe preferred if waiting areas are less occupied, offering the most discretion.

NHS England and its partners have developed a toolkit to help health and social care organisations work together in identifying, assessing and supporting the wellbeing of carers and their families. This toolkit covers new duties on NHS organisations brought about by the Care Act 2014 and the Children and Families Act 2014, and includes numerous examples of positive practice that are already making a difference to Carers and their families.

“There are around 4.8 million carers in England providing care to sick or disabled relatives or friends, or the elderly.”

"TOP TIP"
Practices can gather and review their own monitoring data to better understand and respond to the diversity within their community.
The desire to see a general practitioner (GP) of choice is deemed far more important than opening hours for many patients, while others are comfortable seeing a nurse if a GP is unavailable. Gypsy, Traveller, and Roma and some other BAMER groups however are more likely to go to A&E if their preferred GP is unavailable. See modes of delivery – using the full staff mix.

The GP Patient Survey 2015-16 found:

- 73% of patients aged over 75 had a preferred GP, compared with 36% of those aged 18-74 and don’t have a long term condition.

The NAO report in 2015 shared that:

- Some GP’s make full use of the staff mix to meet demand and to provide continuity of care
- Within the majority of Gypsy, Traveller, and Roma families there is a strong gender divide making it inappropriate for men or women to discuss health issues with members of the opposite sex
- Some groups, like younger adults, prefer to see a GP they know and trust, especially if they have a sensitive health problem.

Whether patients can access the same professional each time they need or want to is described as continuity of care.

The GP Patient Survey 2015-16 found:

- 60% of White patients received continuity of care, compared to 45% of Black and Asian patients
- 81.3% wanted to consult a GP specifically either by phone or in person.

The NAO report in 2015 shared that:

- 65% of all patients were happy to see a nurse if the GP was unavailable.
When a face to face appointment is booked, a patient needs to physically get to the surgery/clinic. Geographical isolation, local support and access to suitable transport are all important in influencing attendance levels. The likelihood of older people in this group attending their appointments is strongly influenced by logistical considerations.

Family and community commitments can take priority for South Asian families and Gypsy, Traveller, and Roma groups e.g. expectations to travel and gather for funerals even if some distance away, or to remain home to support older generations / unannounced arrival of guests etc. which impacts on patients being free to attend an appointment or being able to be brought to an appointment.

Workers may not be able to take time off for general practice appointments or to take their children to an appointment.

TOP TIP

Consider different consultation types such as telephone or online consultations.
Waiting room experience

The waiting room environment and experience is an important consideration when improving and extending access.

**TOP TIP**
The waiting room environment itself is important to ensure a patient feels comfortable and at ease. Having a range of posters which reflect the diversity of your local population, show a clear non-discrimination policy that includes sexual orientation, along with any policies about confidentiality can also assist. (see modes of delivery – Improving communications).

Consider different consultation types such as telephone or online consultations.

Some deaf and blind patients report that poor communication by receptionists has caused them to miss appointments e.g. through a lack of audible or visual cues.

- Some groups are more likely to feel uncomfortable in mixed gender public settings, such as waiting rooms and walk-in clinics
- Individuals who have undergone gender reassignment may have a greater need for privacy when accessing primary care than other sections of the population
- Feelings of discomfort and fears of judgement can often deter trans patients from accessing health care. In some cases extended access appointments (early mornings, or later in the evenings) may be preferred, as waiting areas tend to be less occupied, offering the most discretion.

This existing resource for improving access has some helpful tips focusing on improving the practice environment including for waiting rooms and physical access.
Understanding your local population

Improving access to general practice

Get to appointment

General Practice interaction

1 Identification of health problem

2 Decision to seek help

3 Actively seek help

4 Obtain appointment

5 Get to appointment

6 General Practice interaction

There are a range of physical barriers to access such as unsuitable signage, to information about and timing of appointments and knowledge of treatment choices. People with learning disabilities may need careful preparation for appointments and need to be familiar with places and procedures.

"Around 1 in 5 people have a disability or a limiting long-term illness."

TOP TIP

Consider group consultations for patients with Long term illness
Access a case study here.

Premises, transport and patient information

There are a range of physical barriers to access such as unsuitable signage, to information about and timing of appointments and knowledge of treatment choices. People with learning disabilities may need careful preparation for appointments and need to be familiar with places and procedures.

E-Learning via NHS Education England

> The implications of the Disability Discrimination Act for General Practitioners (GPs). The DDA requires reasonable adjustments to enable access

> Access for people with Learning Disability, this is important when deciding to place hubs across a community to deliver evening and weekend appointments ie ensuring transport links in place on weekends to enable patients to get to hub appointments.

TOP TIP

Care navigation will help to reduce patient journeys

Transport

Access to transport for those with a learning disability, as well as older people, if often a barrier. An estimated 75 per cent of adults with an impairment experience barriers using transport. The cost of transport and distance to the GP surgery can also be a factor.
6. General practice interaction and experience

The quality of the general practice interaction depends on a range of factors which include empathy, capacity and quality of communication within the practice. Some patients need longer appointments such as those with learning disabilities, or those who need communication support/interpreter access. Most important is the ability of all general practice staff to recognise and respond to diversity and promote equality.

**GP Patient Experience survey results 2015-16:**

**Trust & confidence in GP:**
- White British – 66%
- Chinese – 44%
- Bangladeshi – 52%

**GP experience rated good:**
- White British – 45%
- Chinese – 23%
- Bangladeshi – 27%

South Asian and Chinese patients report lower ratings of physician communication than White British patients in primary care settings.

Pakistaní women in Walthamstow reported poor experience relating to trust and affinity to practice, the variation in charges for vaccinations and certificates e.g. for a visa or travel broke down trust.

Over a third of young people rated their last GP experience as average or poor. Due to such issues, young people are more likely to attend A&E than visit their own GP. Less than half of those aged 11-19 would talk to their GP if they had a health concern.

Historic social or health system discrimination can impact a patient feeling at ease during a consultation, for example those who identify as Lesbian, Gay or Bisexual were about one and a half times more likely to report unfavourable experiences especially relevant to primary care intervention.
Consultation duration and format

Capacity includes having sufficient consultation time, with patient and general practitioner requiring equal status.

**Healthwatch data suggests:**

> Existing appointment slots can limit access to a GP for visually impaired people, not allowing time for patients to go through treatment instructions.

> Healthwatch Halton found that six out of 10 local residents were not happy with the length of appointment available.

> Over-65s in Surrey said they would like more time to speak to their GP about the issues concerning them and only being allowed to speak about one thing per appointment was restrictive.

> Women in Derby said they struggled to access services and felt frustrated that often they wanted to speak to their GP about more than one thing but were told they could not.

Black, Asian and Minority Ethnic and Refugee (BAMER) participants of a focus group in Islington shared the following reasons for not preferring phone or email appointments:

> Hearing difficulties

> Concerns about how interpreting would be offered

> Feeling that a face to face appointment allowed the GP to check the patient more thoroughly

> Not having a computer for email contact.

Practices should provide longer appointments for people with a learning disability.

**TOP TIP**

Wider use of other healthcare professionals in general practice (e.g. community pharmacists) will help to address the needs of complex patients.

Communication and language

Trusting, empathetic interpersonal relationships form the basis of effective healthcare and communication is a key driver of collaborative decision-making between patients and general practitioners. Among UK-born individuals identifying as Bangladeshi, Pakistani, or Indian, a respective 30%, 23% and 14% report not speaking English well or at all.

In the healthcare field, the term ‘language-concordance’ describes patients and physicians sharing the same language, and ‘language-discordance’ is the lack of a shared language. South Asian patients frequently report poorer GP communication, however this improves when language-concordant consultations are available.

The GP patient survey reports dissatisfaction from older female Pakistani and Bangladeshi responders in communication including explaining tests and involving patients in decisions.

Half of all deafblind people have left a GP appointment having not understood what had been discussed. Many reported needing to rely on a friend or family member to answer their questions.

Some practices have extended access by providing English as a second language classes at their practice, or in partnership with local Council for Voluntary Service (CVS) organisations. See modes of delivery and access to interpreters sections.

A study undertaken by the UK Youth Parliament found that over a third of young people rated their last GP experience as average or poor.

> Some people with a learning disability are deaf and will find the use of Makaton helpful

> Some carers of patients may be deaf or speak English as a second/third language, or both. They will need to be supported to understand what is being shared in important consultations.

Cultural competency

Cultural competency is about responding to the needs of our diverse population.

Culture affects the way people label illness, identify symptoms, seek help, set expectations for clients, give themselves personal meaning and understand morality. Culture is often referred to as the totality of ways being passed on from one generation to another. Competence implies having the capacity to function effectively within the context of diverse cultures.

TOP TIP

> A resource for all NHS staff working with Black, Asian and Minority Ethnic and Refugee (BAMER) communities in any health and social care setting. It provides:
> Principles of cultural competency and its importance in relation to health and social care services
> Specific information about BAMER communities, including examples cultural profiles (based on demographics of people in London City and LB Hackney)
> Simple and effective self-assessment tools for individuals and organisations which foster improvement.

“How we communicate about our health or social care problems, the way we present our symptoms, when and to whom we go for care, how long we remain in care and how we evaluate that care are all affected by cultural beliefs.”

TOP TIP
A number of practical guides are available to support staff to value diversity and be inclusive in their approach, such as Sexual Orientation – a practical guide for the NHS

This guide for NHS organisations offers practical advice about how to meet the needs of lesbian, gay and bisexual people—both as patients and as NHS staff.

See resources – Policies and guidance, Staff development & training section

Promoting equality

Organisations including NHS Trusts, Clinical Commissioning Groups, the Care Quality Commission and Healthwatch, who oversee and help deliver healthcare, must also follow the Equality Act 2010 and the Health and Social Care Act 2012.

The NHS Constitution sets out the core NHS Values and the Rights and Responsibilities of Staff. This includes a duty to not discriminate against patients or staff and to adhere to equality and human rights legislation.

19% of people with a disability or limiting long-term illness also reported having experienced bullying, abuse, discrimination or exclusion from health services

(Count Me In Too)
Improving access to general practice

This section provides ideas and innovations to increase capacity and improve access for all.

1. New consultation types
   Telephone and online consultations are increasingly being used to expand access, some of these provide additional functionality to help patients manage their care.

2. Access hubs
   In some areas GP surgeries have come together to provide a hub or central access point to extend the availability of general practice access points to manage all patients.

3. Enhancing skill mix
   Prescribing nurses, physicians associates, clinical pharmacists, paramedics and other roles are increasingly complementing the primary care workforce and offer unique skills that benefit patients.

4. Targeting access
   Some access schemes have focused on improving access for specific groups based on their needs including those with complex needs, children & young people, or the frail elderly. In some cases this has included providing consultations outside of traditional care settings.

5. Improving system integration
   Some access schemes have involved closer working with other providers of care, particularly care homes, ambulance services, mental health trusts, A&E, and NHS 111.

6. Prevention and patient empowerment
   Addressing risk, improving prevention, and working with patients to increase their capacity for self-care and self-management requires an upfront investment but reduces demand over time which ultimately improves access.

7. Improving patient flow
   Ensuring that patient needs are met in the most appropriate setting and that there is smooth movement between settings of care can reduce duplication and greatly enhance patient experience and outcomes for patients with complex conditions.

8. Improving communications with patients
   Providing information to patients can help them to identify their health problems and in their decisions to seek help.
### New consultation types

Expanding access beyond traditional face to face consultations poses challenges for some groups of patients but can also help to remove key barriers in the patient pathway, particularly in terms of identifying health issues, seeking help, and getting to appointments.

New consultation types should be viewed as complementary to rather than a substitute for face to face appointments. For people in rural areas or those with mobility issues and carers, the ability to get advice and reassurance easily can be a welcomed improvement.

Group consultations, which are widely used in the US, are also starting to be adopted in the UK and have been shown not only to improve GP efficiency by 300% but also help patients to control their long term conditions, largely due to the benefit of peer support. Most web browsers support instant online translation and telephone translation can be easily integrated, which helps support patients who do not speak English.

Options for improving access

Access hubs

In many areas extended access will be provided by general practice (GP) surgeries collaborating across wider geographic areas to form ‘hubs’ that enable patients from any practice to be seen within the hub. Hubs may incorporate other community services and help to support holistic care, but need to be designed with patients needs in mind to enhance access for vulnerable groups.

Clinical Commissioning Groups (CCGs) and providers should, as a minimum, ensure that hubs are placed in areas with the greatest needs (i.e. poorer health outcomes) and monitor utilisation to ensure that key groups are not excluded (see assessing local issues section). In many areas hubs will be part of plans to create Multispecialty Community Providers and Primary Care Homes and both of these require providers to take greater responsibility for population health including reducing inequalities.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; Placing hubs within the most deprived areas can improve access for those who need it most</td>
<td>&gt; Increased travel may be a barrier for those with mobility issues, for carers, or because of travel costs</td>
</tr>
<tr>
<td>&gt; Hubs may offer a wider array of services and these may be particularly beneficial for patients with complex issues (e.g. social prescribing)</td>
<td>&gt; There is a potential for reduced continuity of care and this is particularly difficult for patients who have experienced discrimination or who have difficulty communicating (link to section 6 of pathway)</td>
</tr>
<tr>
<td>&gt; Larger hubs help to create opportunities for greater skill mix and evidence suggests that primary care at scale is better for staff development</td>
<td>&gt; Patients within the hub practice have been found by some first wave of GP Access Fund schemes to benefit more patients from other sites in the catchment area.</td>
</tr>
<tr>
<td>&gt; Commissioners and providers should ensure that hubs are placed where there are good transport links.</td>
<td></td>
</tr>
</tbody>
</table>

TOP TIP

See how Primary Care Sheffield has improved access for Slovak Roma patients.
Options for improving access

Enhancing skill mix

General practice teams are quickly diversifying to include a number of new roles and other professional groups such as paramedics and pharmacists. This compliments and helps to improve access where GPs are difficult to recruit, but it also offers an opportunity to better meet patient needs by providing new types of advice and support. Practice Nurse roles, for example, have not only expanded to include long term conditions management including asthma and diabetes, but there has also been an opportunity to develop their specialist skills to meet the needs of vulnerable groups such as children, people with learning disabilities, and those with mental health problems.

Social prescribing helps to reduce inequalities by recognising the wider determinants of health such as employment and directing patients to these services. Care Navigators, which are being rolled out nationally as part a £45M commitment within the General Practice Forward View, may help to embed social prescribing as well as helping patients with complex care needs to navigate the health system and this has the potential to improve outcomes for all.

### Opportunities

- New roles, if properly aligned to patient needs, can help to improve outcomes and improve patient experience.
- Clinical pharmacists can help with medication reviews as well as managing patients with long term conditions, older patients particularly may be at risk of non-compliance and therefore benefit from a pharmacist’s involvement in their care.
- Mental Health Therapists in general practice may help vulnerable and excluded patient groups to gain better control of their physical health.

### Challenges

- Training is variable amongst different staff groups, for example with respect to communicating with patients and people from other cultures (see Cultural Competency).
- Some cultures may place less value on non-medical advice (see Health Beliefs).

### Examples of Best Practice

- At Old School Surgery in Bristol the practice pharmacist is a partner in the practice who conducts medication reviews, visits housebound patients, and sees patients with long-term conditions. A community pharmacist, working with the patient list, also helps to manage patients with minor ailments and phones 600 vulnerable patients each month to ensure medication adherence. Old School Surgery’s prescribing costs are 32% lower than the national average.
- The British Medical Association (BMA) has a series of case studies looking at extended roles, such as Extended Scope Practitioners for MSK, an extended primary care team approach (One Team), better use of skills mix to manage long term conditions, and the use of Advanced Nurse Practitioners.
Options for improving access

Targeting access

Some Clinical Commissioning Group (CCG) areas have used access funding to specifically target groups of patients based on their local population's needs. This approach can have a significant impact on reducing health inequalities but will not be suitable for every patient group and so should be combined with other approaches that are less specific (such as telephone appointments).

The specific groups that were targeted as part of the General Practice Access Fund schemes included children and young people, older people, and those with complex health needs. Different approaches have been used to target these groups, from walk-in clinics and health apps for children to mobile health services and community outreach.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; In line with the move to more proactive care, targeted access recognises risk in the community and provides access where needed.</td>
<td>&gt; There may be no ‘one size fits all’ approach to targeting different groups who are experiencing poorer health outcomes.</td>
</tr>
<tr>
<td>&gt; One-Stop type hubs where patients can receive multiple services in one place at one time are hugely beneficial for Gypsy, Traveller, and Roma communities, homeless people and sex workers.</td>
<td>&gt; Existing models of healthcare delivery may not be suitable and this may mean challenging ways of working that are deeply embedded in healthcare professions.</td>
</tr>
<tr>
<td>&gt; Working with your local community may be the best way to identify opportunities to target specific patient groups (link to section on patient participation).</td>
<td></td>
</tr>
</tbody>
</table>

Examples of Best Practice

> In West Wakefield an inflatable health pod is used to offer a variety of health and related services (e.g. Citizens Advice Bureau) from a variety of locations including rural areas and areas with high deprivation. Six GP surgeries in Wakefield are working together to make services more accessible in practices and across the community. The practices 63,000 patients now benefit from longer opening hours, from 8am to 8pm seven days a week operated from a central hub premises. The scheme has introduced a new service directory giving patients better access to community based services as part of a wider on-line care navigation system. Video consultations and electronic messaging are in the process of being launched as well as ‘real time’ web chats and phone consultations with a care navigator.

TOP TIP

See how services in Bradford and Leeds are improving access to care for refugees, asylum seekers and homeless people.
Options for improving access

Improving system integration

Closer working and integrated budgets are helping to remove some of the barriers between settings of care. The Five Year Forward View describes different organisational forms such as Multispecialty Community Providers as well as Primary and Acute Care Systems which are currently being developed.

Improving dialogue and collaborative working between providers does not require formal contracting arrangements. However, from a patient perspective this results in improved outcomes and a better experience of care as well as avoiding unnecessary duplication and delays. Furthermore for some of the most vulnerable groups in society including the frail elderly and those suffering from high levels of deprivation are most likely to receive care from multiple agencies and therefore are most likely to benefit from closer working.

Multidisciplinary Teams (MDTs) are the most common approach to integration for high risk patients but other approaches including wider integration with community health and voluntary services may help a wider segment of the population to stay well longer.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; Collaborating with voluntary sector providers may help to design better services for specific vulnerable or at risk patient groups.</td>
<td>&gt; Work is underway in most areas to integrate social care records into the digital care record but this may take some time and closer working with social care can help to streamline services for those with complex care.</td>
</tr>
<tr>
<td>&gt; More integrated services are easier to navigate and access and this is particularly true for stages 4 and 5 of the patient pathway.</td>
<td></td>
</tr>
</tbody>
</table>

Examples of Best Practice

> In Warrington, a GP Access Fund wave one site, as well as seeking to create equitable provision of primary care and access across all GP providers, paediatric ambulatory care and integrated services including social care are being prioritised in electoral wards of greatest economic deprivation.

> Aware of both national and local agendas to reduce pressure in the A&E system, some wave one General Practice Access Fund schemes have experimented with closer working with A&E providers. Barking and Dagenham and Havering and Redbridge and Darlington linked with their local A&Es so that patients can be referred into extended hours slots.

> GPs in Barking, Dagenham, Havering and Redbridge have now launched three new access ‘hubs’ providing more than 700,000 patients with the opportunity to see a GP in the evenings between 6.30pm and 10pm without having to wait until the next day. Phase two of the project now sees urgent appointments made available via other routes such as a patient's own GP, urgent care centres, walk-in centres and A&E where appropriate, and weekend appointments on Saturday afternoons.
Options for improving access

Prevention and patient empowerment

The Five Year Forward View includes a commitment for a radical upgrade in prevention and public health as well as helping patients to manage more of their own care. Not all patients will initially have the capacity to take on more responsibility for their care, and this may be particularly true for disadvantaged groups.

Studies of the Patient Activation Measure have shown that patients with lower activation levels (i.e. who lack the knowledge, confidence and skills for self-care) have worse outcomes, higher healthcare costs, and a worse experience of their care. Shifting patients towards greater involvement in their care and away from harmful health behaviours helps to reduce demand for health services and therefore increases access for everyone.

Risk factors for specific patient groups vary significantly and so health campaigns and community engagement should be tailored to provide appropriate and culturally sensitive messaging. Evidence also suggests that the inverse care law applies to secondary prevention and thus those most at risk of developing illness are least likely to receive life-saving interventions.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; Prevention is the best way to reduce overall health inequalities.</td>
<td>&gt; Some people may lack the basic resources for self-care and may require non-health interventions as a first priority.</td>
</tr>
<tr>
<td>&gt; Investment in prevention measures including mental health promotion,</td>
<td>&gt; Where possible carers should be engaged if there is less capacity for self-care.</td>
</tr>
<tr>
<td>promoting physical activity, and vaccinations yield positive returns on</td>
<td></td>
</tr>
<tr>
<td>investment in as little as 1-2 years.</td>
<td></td>
</tr>
</tbody>
</table>

Examples of Best Practice

Altogether Better – Health Champions
Health Champions are people who, with training and support, voluntarily bring their ability to relate to people and their own life experience to transform health and well-being in their communities. Since the success of the original Community Health Champions in communities and workplaces, the role and supporting relationships are being adapted, allowing citizens to work as Health Champions in new and dynamic settings, including GP practices and acute hospitals.

Extended Primary Integrated Care (EPIC) Brighton & Hove practices (Surrey and Sussex)
A community navigator scheme has been launched across 16 practices in Brighton and Hove, for patients who may be isolated or lonely and would benefit from connecting to services within their community rather than purely medical care. Working with voluntary care organisations, Age UK and Impetus, trained community navigators are providing support for patients with complex needs in community settings, particularly those who are living on their own. They are helping to signpost individuals to third and voluntary sector organisations, and other local resources, to meet their needs. Community Navigators have seen 38 clients via 85 Navigation one hour sessions.
Options for improving access

Improving patient flow

Many general practice surgeries and GP federations are using one or more methods to optimise patient flow and these include GP triage, which is often combined with the option for telephone consultations and walk-in sessions to meet on the day demand.

The same limitations to GP triage exist as for telephone consultations (link to new consultation types – page 2) and in addition to these, studies are so far neutral as to whether these systems create more capacity in the system or simply redistribute existing resources.

In principle patient flow can be optimised by any form of process improvement. Redirecting patients to the most appropriate service, including social prescribing by clinicians and signposting by practice receptionists is also an important factor in managing flow. Optimising capacity to match demand also helps to improve patient flow and there are various methods for doing this.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; Increases the number of patient contacts which enables more opportunistic follow up.</td>
<td>&gt; GP triage can act as a barrier for many at risk groups, systems therefore need to be sensitive enough to pick up on this and to offer alternatives.</td>
</tr>
<tr>
<td>&gt; On the day access may be more suitable for those with chaotic lives.</td>
<td></td>
</tr>
</tbody>
</table>

Examples of Best Practice

> See West Wakefield and how they are designing services to help patients for whom the GP isn’t really the best person to see. Patients could be seen and treated quicker by a nurse or a physiotherapist for example and in some cases, when the GP practice is not the right place at all.

> See NHS Network for active signposting and social prescribing which can help improve patient flow.
Options for improving access

Improving communications with patients

Studies have shown that in addition to traditional NHS definitions of quality that encompass safety and efficacy people tend to define quality in terms of access, involvement, and the communication skills and empathy of their clinician.

Doctor patient communication is one of the key factors influencing the primary care interaction (see stage 6 or Patient Pathway Communication and Language) as part of the patient pathway and studies have indicated a direct correlation between effective communication and patient outcomes.

Information can be provided through leaflets that can be downloaded in a number of different languages (see Understanding the Health System) or via practice websites or links to external websites or apps.

<table>
<thead>
<tr>
<th>Opportunities</th>
<th>Challenges</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; Better communications can improve outcomes for all patients and there are many readily available resources (link to communications section of toolkit) to help.</td>
<td>&gt; Improving communications in patient interactions may require some upfront investment in training.</td>
</tr>
<tr>
<td>&gt; Opportunities to decrease patients attending A&amp;E and avoid DNAs (did not attend).</td>
<td></td>
</tr>
</tbody>
</table>

**Examples of Best Practice**

**Slough Steps to the Future (Thames Valley)**

The project in Slough was built on insights from patients about primary care and what they believed was needed to improve access and to help them keep well. It was co-designed by patients with their GPs and practices. GPs in Slough have been offering 8am to 8pm extended hours on weekdays since July 2014 and on weekends since August 2014 (9am-5pm Saturday and Sunday) for over 148,000 patients. To date patients have expressed in excess of 98 percent satisfaction with their experience of the new service.

Alongside extended access, patients can subscribe to receive free texts to promote wellbeing, as well as get reminders about routine health checks. Patients with complex needs or unstable conditions are offered a direct line to the clinician with whom they work most closely. Slough GPs are working with their patients to review the words that are used in consultations to ensure that patients can understand and get the most out of their appointment. Patient Navigators are being piloted through work with the local voluntary services to help people make the best use of local information that is already available to help them keep well.

See communications section in the Patient Pathway approach.
